

Table 3. Dermatomyositis and Polymyositis

	Dermatomyositis	Polymyositis
Pathophysiology	Humoral attack against muscle capillaries and small arterioles.	T-cell mediated cytotoxic process against unidentified muscle antigens
Clinical presentation	<ul style="list-style-type: none">• Symmetric, proximal muscle weakness• Arthralgia• Dyspnea, dysphagia, dysphonia• Arrhythmia	<ul style="list-style-type: none">• Symmetric, proximal muscle weakness• No- or mild pain or muscle tenderness• Systemic symptoms
Skin findings	<ul style="list-style-type: none">• Gottron's papules• Heliotrope rash	Absent
Diagnostic tests	<ul style="list-style-type: none">• Elevated creatinine kinase (CK)• anti-Mi-2 (typical rash)• anti-MDA5 (lung disease)• anti-TIF1γ (risk for malignancy)	<ul style="list-style-type: none">• Elevated CPK, aldolase• ANA• anti-Jo-1• Leukocytosis, thrombocytosis
Muscle biopsy	<ul style="list-style-type: none">• Perivascular and interfascicular inflammatory infiltrates• Perifascicular atrophy	<ul style="list-style-type: none">• Intrafascicular (endomysial) mononuclear infiltrate with patchy necrosis
Treatment	<ul style="list-style-type: none">• High-dose glucocorticoids plus glucocorticoid sparing agent• Screening for malignancy	<ul style="list-style-type: none">• Systemic glucocorticoids• Glucocorticoid sparing agent (e.g., methotrexate, azathioprine)
